# Internet of Things Acoustic Emission: Systems and Applications

Jiehui Xie, Shuang Wang, Wei Liu, Huilan Yang, Lidong Zhang, Shifeng Liu

QingCheng AE Institute Co., LTD, China 510670, xjh@ae-ndt.com

Abstract Internet of Things Acoustic Emission (IOT AE) was developed and introduced in hardware, software and network structure. IOT AE transmits the data and analysis results to the network server through the Internet/intranet. The analysis results can go to the end user's smart phones and PCs as alarm info. Users don't need the acoustic emission technicians to operate IOT AE. So IOT AE can be used as remote long-term unattended monitoring and automatic alarm system. Compared with traditional acoustic emission instrument which needs to process the data manually to get the detection and monitoring results, IOT AE control the data acquisition and data analysis by embedded software automatically. Besides the long-term cycle of self-learning correction of artificial intelligence based on big data on the server makes the system have the ability of self-learning, self-improvement and continuous improvement of performance.

This paper introduces the IOT AE systems developed and discusses the application of IOT AE technology of monitoring and alarming for valve leakage, wire rope breakage and tool wear, etc..

Index Terms Acoustic Emission, Internet of Things (IOT), remote monitoring, unattended, alarm

#### **1 IOT AE System Introduction**

#### 1.1 Architecture of IOT AE monitoring and alarm system

IOT AE system consist of AE sensor, AE data acquisition and data analysis module (AE module), internet/intranet communication module, server/smart phone/PC. Firstly, the AE sensor installed on the monitoring object (valve pipeline, bridge steel cable broken wire, CNC machine tool, etc.) collects signals, and converts the tiny mechanical vibration signals into voltage signals. Then the AE module processes the voltage signal and outputs the results (alarm info, AE waveform and AE hit parameters). The outputs of the AE module are transmitted to the server/smart phone/PC by internet/intranet communication module.

The system architecture is shown in Figure 1

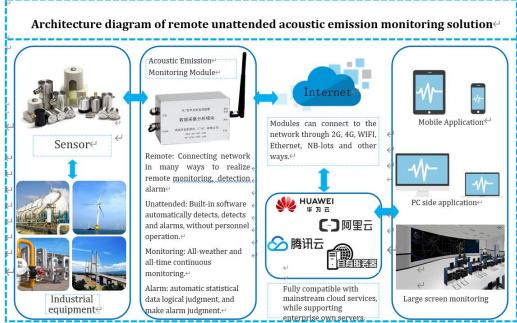

Fig. 1 Architecture of IOT AE monitoring and alarm system

There are many available internet/intranet communication ways such as GPRS, 4G, 5G, NB-IoT, Lora, ZigBee, WiFi, RJ45 Cable, etc. for various applications.

Servers can be Internet cloud servers such as Alibaba cloud Internet of things servers, local LAN servers such as petrochemical plant for valve monitoring and alarm system which only needs to display alarm results in the control room of the plant. Servers can also be local servers + Internet servers and other networking structures according to applications.

# 2. IOT AE systems developed/developing

### 2.1 RL1 IOT AE system

RL1 IOT AE is designed and developed/developing for continuous AE signals such as leakage signals. Table 1 is the specification and Fig 2 is the system functional block diagram.

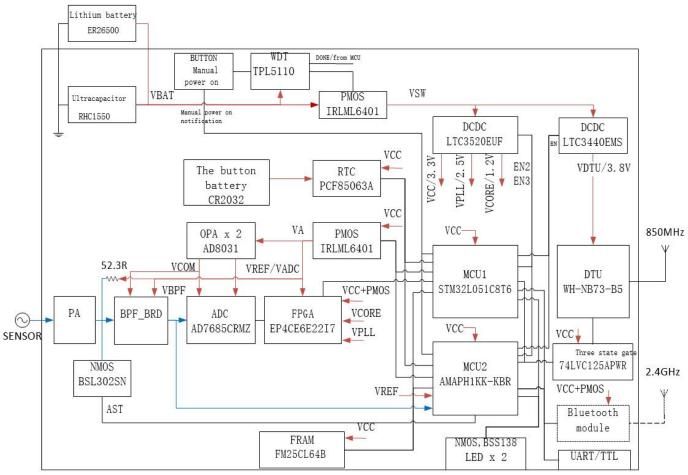

Fig 2 RL1 functional block diagram

Figure 3 shows the AE module, its battery and NB-IOT(Narrow band interenet of Things) chip are in the box, sensor is out off the box.

# 2.2 RAE1 IOT AE system

RAE1 IOT AE is designed and developed/developing for burst AE signals such as cracking signals. Table 1 is the specification and Fig 4 is the system functional block diagram.

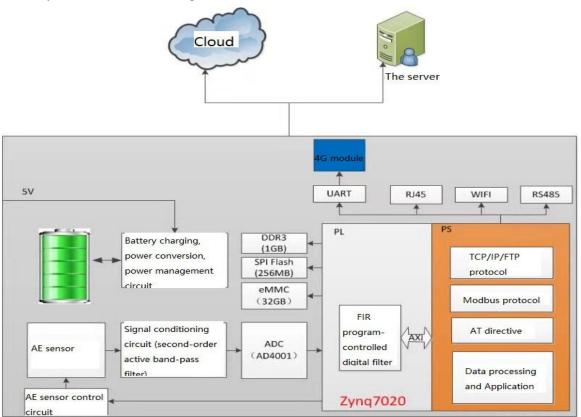

Fig 4 RAE1 functional block diagram

New RL1/RAE1 IOT AE systems are in developing and can be the integrate structure or separate structures as shown in Fig 5 for various applications.

Fig 5 shows the integrate and separate RL1/RAE1: Above right: integrate of sensor/battery/AE module/4Gmodule; Above left: DC power and sensor are out of metal cylinder with AE module and 4G module; Above center: 4G module out of cylinder; Below left: DC power out of the cylinder; Below right: Different cylinders holding different parts inside.

Fig 5. Integrate and separate RL1/RAE1

# 3 Testing of RAE1 and RL1 IOT AE system

### 3.1 Testing layout and procedures

The water tap and water pipeline are used for generating water leakages. The sensors are placed on the water tap to monitor the water leakages of the tap. The water leakages are generated by operate the tap at the positions of close, open a little, open large, corresponding to no leakage, small leakage and large leakages. Fig 6 shows the testing layout and the RAE1 and RL1.

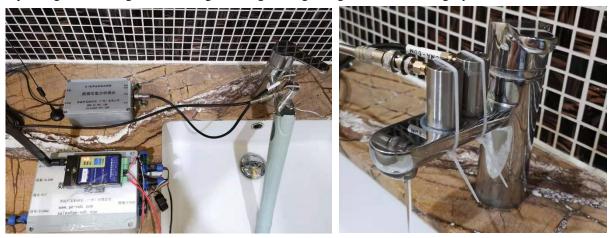

Fig 6 Layout of testing on tap and RAE1/RL1

#### 3.2 The RL1Testing data

The setting of RL1 in this experiment: 16bit sampling accuracy; 200kHz sampling rate; filter 20khz-100khz; manual sampling once every 5 minutes; ls35 sensor, resonance frequency 15khz-70khz, central resonance frequency 35kHz. The operation process of faucet controlling water flow is shown in Table 3.

Access the server through the laptop, and the historical data is shown in Table 2. It can be clearly distinguished from the historical RMS data of the five stages.

Equipment number	Instrument Name	Data point ID	Time	characteristic parameter	numerical value	characteristic parameter	numerical value

#### 3.3 The RAE1 Testing data

The setting of RAE1 in this experiment: Digital filter 20khz-100khz; Hit threshold 60dB; HDT = 5us, PDT = 3us, HLT = 5us; ls35 sensor, resonance frequency 15khz-70khz, central resonance frequency 35kHz. The operation process of faucet controlling water flow is shown in Table 4.

Fig 11 shows the history data from server of RL1 AE IOT system. RMS and ASL have useful references, and the difference between water out and no water out is obvious, as shown in the figure. Fig 12 shows the leakage alarm display on the smart phone for RAE1.

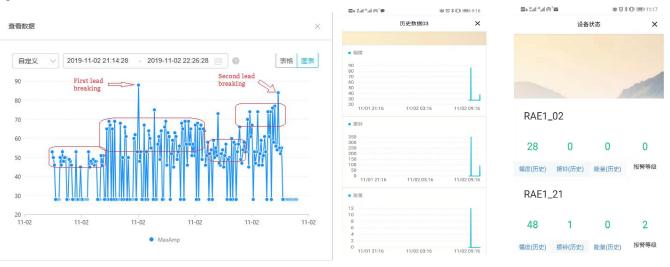

Fig 11 Check historical data through laptop access server

	Lead breaks at 21:40				
22:00-22:12	Tap off	45 dB -60dB	2. Accurate acquisition of lead breaking signal;		
22:12-22:21	Tap large angle on $(70 \text{ml/s}) +$	45 dB -78dB			
	Lead breaks at 22:20				
22:21-22:26	Tap off	0 dB -55 dB			

Table 4 results of the testing of RAE1 IOT AE for tap water leakages

### 3.4 Discussion

It is very clear that both RAE1 and RL1 IOT AE systems can correct monitoring and alarms the leakages of the water tap. It can be concluded that valve leakages can be success monitored and alarm report by RL1 and RAE1 IOT AE systems if just use the valves instead of tap for the same testing.

#### **4** Conclusions

From above jobs it can be concluded that IOT AE systems are technically available now and IOT AE are useful for remote unattended monitoring and alarm report.

In future the long-term cycle of self-learning correction of artificial intelligence based on big data on the server makes the system have the ability of self-learning, self-improvement and continuous improvement of performance.
